#### **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-4 and 6-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over US 5,462,416 to Dennehey et al in view of US 5,385,540 to Abbott. Dennehey discloses a blood pumping cassette within a blood circuit with a plurality of tubing lines (134, 136) that connect to fluid passageways within the cassette. The cassette is comprised of a rigid portion connected to a flexible portion. (See FIG 9; column 6.) The blood circuit further comprises a control unit with a component interface region and an area that interfaces with the cartridge, and a pump. (See FIG 76; column 20.) The system further comprises blood reservoirs (see column 16, lines 40-45), flow control clamps, air bubble detectors (see column 10, lines 25-35). The cassette further comprises pressure sensors and valve stations that are actuated to regulate fluid flow (see columns 6-7).

Abbot discloses a blood circuit with a cassette that serves to control fluid flow in a cardioplegia circuit. Use of the cassette serves to simplify the fluid control, preventing the operator from having to manually set up the fluid channels in the complicated circuit. Abbot discloses that the system incorporates an oxygenator 14, pumps in the pump cassette that send fluid from the oxygenator

Application/Control Number: 09/963,878

Art Unit: 3762

through the rest of the circuit back to the patient, and a cardioplegia circuit that combines blood and cardioplegia solution in the circuit (see columns 3-4). Abbot fails to disclose the tubing lines, valves, and sensors as claimed, but Dennehey, as delineated above, disclosed those claimed limitations. Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to add the tubing lines, valves, and sensors, along with the other claimed limitations found in the Dennehey device, to the cassette disclosed by Abbott in order to provide a simplified, controllable cardioplegia fluid circuit, as taught by Abbot.

With regard to applicant's claim limitations drawn to the functions of the blood circuit, the pump, the reservoir, flow control clamp, sensors in the claims, the claims recite the functions of the devices in narrative form, and such recitations have not been given patentable weight. In order to be given patentable weight, a functional recitation must be expressed as a "means" for performing the specified function, as set forth in 35 USC 112, 6<sup>th</sup> paragraph, and must be supported by recitation in the claim of sufficient structure to warrant the presence of the functional language.

3. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over US 5,462,416 to Dennehey et al, in view of US 5,820,579 to Plotkin, in view of US 5,385,540 to Abbott. Dennehey discloses the blood circuit and cassette as claimed including an air detector, but fails to disclose a valve with diverting mechanism. It is well known within the art of blood processing to provide air detectors and divert blood with bubbles in it so as not to introduce air bubbles into the patient, as taught by Plotkin. Plotkin discloses a cardiopulmonary bypass

Art Unit: 3762

circuit with a pump and an oxygenator and an air detector 36. When the air detector senses a bubble in the line, microprocessor/controller 50 employs valve 38 to divert the blood and air bubble into recycle line 48, which serves as a reservoir, in order to prevent the air bubble from being introduced to the patient. Plotkin discloses that his system is better than conventional air trap systems, since the diverting technique diverts a minimum amount of fluid while maintaining adequate blood output to the patient (see column 4). Therefore, it would have been obvious to one of ordinary skill in the art at the time of invention to add a diverting mechanism to the cassette and air sensor of the Dennehey/Abbot device in order to prevent introduction of air to the patient while maintaining adequate blood flow in the system.

### Response to Arguments

- 4. Applicant's arguments filed 7 April 2004 have been fully considered but they are not persuasive.
- 5. In response to applicant's argument that there is no suggestion to combine the references, the examiner recognizes that obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so found either in the references themselves or in the knowledge generally available to one of ordinary skill in the art. See *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988) and *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992). In this case, the combined references do not teach away from

Art Unit: 3762

one another as argued by applicant. Rather, looking at the Dennehey reference (or the combination of Dennehey and Plotkin) in view of Abbot merely suggests improvements to the Dennehey device, since Abbot specifically contemplates embodiments found in the Dennehey device and improves upon them.

Furthermore, examiner is not combining the references to show any compatibility between the pumping systems of the two references. Rather, examiner has found another reason for combining the references, namely the presence of the oxygenator in the Abbott device. Therefore, the references are properly combined.

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Leslie R. Deak whose telephone number is 703-305-0200. The examiner can normally be reached on M-F 7:30-5:00, every other Friday off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Angela Sykes can be reached on 703-308-5181. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
